Exhumations from the Desks of Internet Communications

Recommended Lastest Stienographer: Sentential Stiens (8.6Gb)

Our recommended latest stienographic is by two of our tiesaa sprockets, that have a different scribe than the gremlins+gramlins species main by-cause one of their uncommon called: Dbase + Casey; it is based in our new operating system called Sentential Entity, which is linux but can run anything even apple, centos, citrix, microsoft, samsung you name it you can get it from our repositories once you mount our stien if you don't have a working Extract command, it is in an 8.6Gb ISO file and will only have one release, you have to mount it on a disc or memory key and use your boot menu in bios to install it on a machine, it has a Nobel Thou Art mode that is protected for saliva testing as well as several other special modes for different application, run the following command on your stienbox to get it:

```
extract Sentential-Stiens.iso
```

It is good for any legal services down to the average lawyer for .lawyer mounting and writing as you can use it has a desktop much like Ubuntu which Sentential Entity is based in but written entirely from scratch from the ground up; which we will be releasing to public when the versioning we are happy with has little or any bugs on sentential.coop there is heaps of pre-alpha to claim and maintain that wasn't included in it's release lots of completed applications and so on when we do, but for now this is the first pilot of seeing Sentential Entity as the box Sentential Stiens, we recommend even deploying this you do it from a portable mobile computer like a laptop first before and it will from there be able to build and tie in server mounts…
